

UAE HRM Platform

Project introduction, access levels and feature guide

About the project

- The UAE HRM Platform brings employee records, onboarding, attendance, leave, payroll and employment administration into one web application.
- It is designed for UAE businesses and includes configurable compliance calculations, government employment details and Wage Protection System (WPS) payroll workflows.
- The product also has a SaaS administration layer: the platform operator can oversee customer companies, subscriptions, invoices and WPS providers.
- Its long-term direction includes accounting, point of sale (POS) and additional business operations modules.

Who this guide is for

- Business owners and company administrators evaluating the product and its operational coverage.
- HR teams, payroll teams, managers and employees learning which workflows relate to their work.
- Developers and project stakeholders who need a clear distinction between implemented behavior and the wider product design.

How to read this guide

- Feature descriptions are based on repository screens, API routes, services and default role assignments reviewed on 13 September 2026.
- Access descriptions reflect default seeded roles. A database with customized assignments may behave differently.
- This is a code-based product guide, not a fresh runtime acceptance test or verification of current UAE law. Compliance sections describe software capabilities.

Guide contents & workflow

A connected employee lifecycle, with separate responsibilities for each team

Contents

- Pages 3-4: Access levels, default permissions and organizational scope.
- Page 5: Company organization and employee records.
- Page 6: Onboarding, login accounts and employee self-service.
- Page 7: Attendance tracking and attendance corrections.
- Page 8: Leave requests, approvals and balance management.
- Page 9: Sick-leave pay, public holidays and policy settings.
- Page 10: Payroll processing, gratuity and final settlement.
- Page 11: Government profiles, MoHRE establishments and WPS.
- Page 12: Compliance rules, Emiratization and compliance reports.
- Page 13: Documents, dashboards and audit logs.
- Page 14: SaaS billing, architecture, implementation boundaries and sources.

Typical end-to-end workflow

1. Configure the company, branches, departments and job titles so employee records have a clear organizational home.
2. Create an employee record, start onboarding, complete required tasks and create login access when needed.
3. Maintain attendance, process correction requests and manage employee leave requests and balances.
4. Configure salary components, run payroll, review the result and prepare WPS salary transfer files.
5. Monitor documents, contracts and compliance indicators; preserve recorded decisions and calculations for review.
6. Extend or renew employment, rehire former employees, or record termination and final settlement.

Access levels: administrators

Authentication identifies the user; permissions determine the available actions

Sign-in and permission model

- Laravel Sanctum protects authenticated API routes. The frontend uses an authentication store and protected route middleware to manage the user session.
- Permissions are assigned through roles. Separate permissions exist for viewing, creating, updating, approving and exporting records.
- Salary visibility is controlled separately from general employee visibility. Seeing an employee profile does not automatically grant access to salary fields.
- Server-side controller checks use permission and company access helpers. Hiding a button in the frontend is only part of the user experience.

Super Admin / System Admin

- Receives every permission defined by the default permission seeder and has access to platform administration operations.
- Manages subscription plans, assigns company subscriptions, creates invoices and records payments.
- Maintains WPS provider configuration and reviews platform-level WPS risk information.
- Company selection behavior depends on the endpoint: the shared company helper defaults a super admin to the first company. Do not assume every screen provides unrestricted company switching.

Company Admin

- Receives all seeded permissions except `companies.create`. This includes company settings, employee changes, salary visibility, attendance, leave, payroll, documents and audit logs.
- Can configure operational settings, manage organizational records and approve sensitive processes through the relevant endpoints.
- Has WPS proof-verification and manual-override permissions in the default assignment.
- Platform subscription and invoice administration still explicitly requires the `super_admin` role; broad company permissions do not grant platform billing administration.

Access levels: teams & employees

Default assignments are specific; role names alone do not define the data boundary

HR Manager

- Can view, create and update employees; view, create and update attendance; view, approve and reject leave; and view, upload and delete documents.
- Can view audit logs and WPS settings, and view, create and update MoHRE establishment records.
- Does not receive salary visibility, payroll processing, leave.create, attendance.approve or general settings.update by default.

Payroll Manager

- Can view employees and salaries, view/run/approve/export payroll, view audit logs and inspect MoHRE and WPS settings.
- Can generate and submit salary transfers, update transfer status and upload transfer proofs.
- Does not receive transfer-proof verification, manual override or general settings.update by default.

Department Manager and Employee

- Department Manager: default permissions cover employee viewing and leave viewing, approval and rejection. They do not include payroll or salary visibility.
- Employee: default permissions cover attendance viewing, leave viewing/creation and document viewing/upload. Dedicated self-service pages expose personal information.
- Employee self-service endpoints and relevant document, attendance and leave handlers link activity to the logged-in employee record. Combined administrative roles can change self-service classification.

Organizational scope: current limitation

- The role-assignment model stores company, branch, department and scope fields. The intended scope levels are global, company, branch, department and self.
- The reviewed employee and leave list queries enforce company scope but do not apply a department-manager department filter. Department-only visibility should not be represented as fully implemented.
- Branch Manager is described in the product design but is not one of the six default seeded roles. A complete role-management interface and uniform scope enforcement require further work.

Company & employee management

A central directory for organizational structure and employment records

Company, branches, departments and job titles

- Company settings hold the business identity and configuration used across operational screens.
- Branches represent the company's operating locations. Departments organize teams, and job titles provide reusable position names.
- Dedicated settings screens and API operations allow authorized users to maintain these reference records.
- Employees are linked to organizational records so HR can understand where people work and who they report to.
- Company ownership checks help keep linked records within the appropriate customer company.

Employee directory and profiles

- Create employee records, open detailed profiles, update employment information and remove records through permission-controlled operations.
- Store identifiers and contact information together with branch, department, job title and reporting manager relationships.
- Search the directory by employee code, display name or work email; filter by employee status and upcoming contract expiry.
- Use WPS readiness filters to identify employees with missing details, invalid bank IBANs or missing work-permit information.
- Keep an HR record separate from a login account, allowing HR to register a person before self-service access is created.
- Track contract and service periods through extension and rehire actions rather than relying only on a single hire-date field.

Practical benefit

- HR maintains a consistent employee record that can be referenced by onboarding, attendance, leave, payroll and document workflows.
- Salary-related fields remain subject to the separate salary permission; the directory is not intended to make pay information available to every manager.

Onboarding & self-service

From a new employee record to day-to-day personal access

Onboarding workflow

- Create reusable onboarding templates containing tasks that can be applied to new employees.
- Start an onboarding case for an employee and generate the associated work checklist.
- Track task progress and completion so HR can see what remains before onboarding is closed.
- Complete the case through an explicit completion action. This supports a managed transition into active employment.
- The wider design includes invitations and richer task types; an automated invitation-delivery and acceptance journey should not be assumed from the presence of invitation tables.

Employee login access

- An authorized user can create an account for an existing employee through the employee-account operation.
- The employee record links the login identity to the relevant HR information and self-service pages.
- Login accounts and employment records serve different purposes: account access controls use of the application, while the employee record stores the employment relationship.

Employee portal

- My Profile displays the logged-in employee's employment details, branch, department and job title.
- My Attendance provides access to personal attendance information and the employee correction workflow.
- My Leave provides a personal entry point for leave requests and status tracking.
- My Documents allows personal document access and uploads according to the employee permissions.
- The personal dashboard summarizes today's attendance, recent leave, upcoming approved leave, expiring documents and pending attendance corrections.
- A dedicated self-service payslip page and employee profile-edit endpoint were not found in the reviewed route/page inventory.

Attendance & corrections

Maintain daily records and record the reasons for later changes

Attendance records

- Maintain employee attendance through create, view, update and delete API operations and the attendance screen.
- Capture attendance dates, check-in and check-out information, breaks, status, source and notes as supported by the attendance data model.
- Use the record list to review attendance activity and locate entries that require administrative attention.
- Employee self-service restricts the employee view to the linked employee record; administrative access is permission controlled.
- Manual attendance changes create an audit trail so later reviewers can distinguish an administrative edit from the original record.

Correction request workflow

- Employees can raise a correction request when an attendance entry needs review, instead of directly changing the source record.
- The request preserves proposed changes and the reason for the correction, giving reviewers context for their decision.
- Authorized reviewers can approve or reject requests through dedicated actions.
- Approval applies the accepted correction to the attendance record; rejection preserves the outcome without treating the proposed time as approved attendance.
- Pending correction counts appear in employee and operational views to make outstanding work visible.

Access and expansion boundaries

- Approval requires the relevant attendance approval permission. The default HR Manager assignment has attendance editing permissions but does not include attendance.approve.
- The structure is intended to accommodate future biometric or mobile attendance sources. Live device integration, geofencing and biometric synchronization are not established by the current feature inventory.

Leave requests & balances

The Leave screen connects submission, review and balance visibility

Submit and review leave

- Choose an employee, leave type, start date and end date, then provide a reason for the request.
- Preview calendar days and the days charged against the leave balance before submitting. The preview can list excluded public holidays.
- Link an uploaded medical certificate when the leave type or request requires supporting documentation.
- Submitted requests start as pending and reserve balance days. The backend validates employee ownership, eligibility, dates and supporting document relationships.
- Review pending requests with requested days and available balance before approval. Approve or reject through separate permission-controlled actions.
- Filter request history by employee and status, use table-column filters and review the latest recorded note.

Leave balances and annual accrual

- Track balances by employee, leave type and leave year, including opening, accrued, carried-forward, used, pending and closing days.
- Authorized settings users can enter adjustments, encashed days and explanatory notes through the Leave Policies screen.
- Run annual accrual for one employee or all active employees for a selected year and calculation date.
- Use pending and used balances to distinguish requested time from approved consumption.
- The current Leave Policies screen primarily manages balances and accrual. It should not be presented as a complete visual designer for all branch-specific policies and multi-stage approval workflows.

Example operational flow

- An employee submits annual leave, the system reserves the relevant days, a reviewer checks the available balance, and the approval or rejection updates the request and related balance state.

Leave pay & policy settings

Calculation support links absence records with payroll outcomes

Sick-leave pay calculation

- A dedicated backend calculator and pay service determine the pay effect of a sick-leave request using the applicable rules and employee context.
- The calculation can split leave across full-pay, half-pay and unpaid tiers rather than assigning one pay rate to an entire request.
- Previously used sick leave and probation-related conditions affect the calculation, alongside documentation requirements.
- The Leave screen offers a sick-pay preview so users can inspect the result associated with a request.
- Stored calculation items and rule snapshots support later payroll review and make the basis of a historical result traceable.

Public holiday management

- Authorized users can maintain public holiday records and use an import operation to populate holiday data.
- Holiday information feeds the leave-day calculation, including the on-screen explanation of dates excluded from a request.
- Company compliance settings include public-holiday treatment, allowing the calculation to follow the configured company behavior.

Company leave and payroll settings

- Compliance settings expose annual accrual and carry-forward options, sick-leave documentation and notification settings, and Emiratisation monitoring.
- Payroll Policies offers a daily-wage divisor choice: a fixed 30-day calendar, actual calendar days, or working days in the month.
- Authorized changes are saved through backend validation and recorded for audit review.
- The product design requires policy values to respect legal minimums. The presence of configurable fields does not mean every possible legal or contractual scenario is covered.
- This guide intentionally does not restate statutory day limits or contribution amounts as current law; it explains how the software stores and uses rules.

Payroll & final settlement

Salary calculations, approvals and employment closure

Payroll foundation

- Maintain salary component definitions and assign components to individual employees.
- Create a payroll period, run the payroll service and inspect the resulting payroll and payslip records.
- Keep calculation line items so earnings and deductions can be reviewed instead of relying only on a final net amount.
- Use salary-linked leave calculation items where applicable to reflect absence-related pay effects.
- Approve the payroll period through a separate action before continuing the relevant payroll export workflow.
- Payroll access is split into view, run, approve and export permissions. The default Payroll Manager receives all four.

Gratuity and termination

- Calculate gratuity through a dedicated backend service using employee service information and configured rule data.
- Record termination date, last working date, termination type, reason and supporting notes.
- Build a final settlement from calculated gratuity plus entered leave encashment, notice pay and other earnings, less entered deductions.
- Preserve a calculation snapshot so the gratuity basis can be reviewed after the employee leaves.
- Creating termination records updates the employee to terminated and closes the active service period in the current implementation.
- Record final-settlement payment status and a payment reference through a separate mark-paid action.

Practical boundaries

- Entering or marking a settlement as paid records an administrative event; it does not itself execute a bank payment.
- Some settlement amounts are provided as inputs. Do not assume every amount, including leave encashment and notice pay, is independently derived by a complete legal calculation engine.

MoHRE & WPS payroll

Employment identifiers and traceable salary-transfer preparation

Government and establishment records

- Maintain employee government profiles alongside the general employee record, including information used for payroll readiness.
- Manage MoHRE establishment records so the company's employment registrations can be associated with payroll configuration.
- Configure company WPS settings and identify incomplete employee data before attempting an export.
- Readiness checks identify missing permit information and invalid or missing banking details.

Salary-transfer batches

- Generate a WPS export from a payroll period and store a payroll batch for later review and download.
- Exporter implementations exist for generic SIF output, Emirates NBD and FAB formats.
- Review batch details and update submission or processing status as the transfer progresses.
- Upload transfer proof, download supporting evidence and use a separate verification action for authorized reviewers.
- Maintain a distinction between generating a file, reporting submission and recording the transfer outcome. These are separate workflow steps.

Compliance monitoring and access

- WPS summaries and platform risk views expose salary-transfer readiness, due-date information and compliance-related indicators.
- Default Payroll Managers can prepare transfers and upload proof. Company Admins and Super Admins also receive proof-verification and manual-override permissions.
- The code includes file-export and status-tracking workflows. A direct bank payment connection or live MoHRE submission integration is not established by these features.
- Actual acceptance of exported files by a bank or WPS provider needs provider-specific validation; exporter class names alone do not demonstrate external certification.

Compliance & Emiratisation

Configurable rule data and reports for administrative review

Versioned compliance approach

- Legal rule sets and rule items provide a place to store calculation rules, versions and source references.
- A legal-rule repository and dedicated backend services keep calculations separate from page rendering and controller orchestration.
- Company compliance settings select calculation behavior, and recorded snapshots preserve the rule basis for supported historical calculations.
- The Compliance screen exposes legal rules and company settings to appropriately authorized users.

Emiratisation monitoring

- Use employee nationality and skilled-worker information together with company category information to calculate a staffing indicator.
- Compare relevant active employee counts with the configured rule requirement to identify a potential shortfall.
- Display required and missing employee counts and estimated contribution exposure where supported by the configured rule.
- Save an Emiratisation snapshot to preserve the calculated staffing position at a point in time.
- Monitoring can be enabled through company settings. The result depends on employee data completeness and the configured rules.

Compliance reports

- A dedicated compliance report screen and summary endpoint bring compliance information together for review.
- Export the report through the backend export operation for sharing or further analysis.
- Use stored rule snapshots and audit events to explain why a result or setting differed at an earlier point in time.
- The product treats calculated compliance results as guidance. This guide does not verify the freshness of seeded legal rules or certify a company's compliance.

Documents, dashboards & audit

Operational visibility with records that support follow-up

Employee documents

- Upload a file linked to an employee, with a document type, title and optional issue and expiry dates.
- Store file metadata including original filename, MIME type, file size, storage disk and uploader.
- Download documents through permission-checked endpoints. The current preview endpoint supports image documents.
- Organize stored files under company and employee paths using generated filenames, with database records linking files to their owners.
- Employees can view and upload their own documents; deletion is restricted to roles with `documents.delete`.
- The implementation uses the configured Laravel filesystem disk. A complete default AWS S3 provisioning and signed-URL system is not established by the reviewed dependencies and services.

Dashboards and navigation

- Administrative dashboards bring together HR analytics, contract reminders, recent activity, payroll, WPS readiness, documents and operational counts.
- Employee dashboards show personal attendance, leave and document reminders.
- Role-aware navigation directs users to relevant areas, while table-column filters make records easier to locate.
- Guided feature-tour support exists in the frontend to help explain parts of the interface.

Audit history

- Audit records capture sensitive changes such as employee updates, document operations, attendance corrections, leave decisions and payroll-related actions.
- The audit service can record before-and-after information and the business action involved.
- Audit listing and detail endpoints let authorized users inspect recorded changes.
- Audit logs are an operational review aid; this repository review does not establish immutable retention or complete logging coverage for every possible action.

Platform, architecture & status

What is implemented, what remains broader product scope, and where to look next

SaaS administration and billing

- Super Admins can create plans, assign company subscriptions, generate invoices and mark invoices paid. Companies can retrieve their current billing information.
- The billing workflow records subscriptions and payment status. An integrated payment gateway and automatic service suspension were not established by the reviewed implementation.
- The Platform Settings page explicitly remains a placeholder for future platform-wide configuration.

Technical structure

- frontend/: Nuxt 4, Vue 3, TypeScript and Pinia for screens, forms, navigation and API communication.
- backend/: Laravel 13, PHP 8.5 and Sanctum for authentication, validation, business services and persistence.
- shared/ holds shared contracts/constants; docs/ holds product and technical references; scripts/ holds development helpers.
- Docker Compose provides PostgreSQL and Mailpit for local infrastructure. The frontend and backend remain separate applications in one repository.

Implementation boundaries and verification

- Accounting, POS, full platform settings, richer policy/workflow designers and complete S3 provisioning remain broader scope or unfinished capabilities.
- Department/branch scope enforcement and role-management coverage need further work before the intended access model can be described as complete.
- Tests exist for authentication, employees, attendance, leave, payroll, WPS, compliance, billing and self-service. This guide did not rerun them or verify a live deployment.

Repository sources used for this guide

- README.md; backend/routes/api.php; frontend/app/pages/; backend/app/Services/; backend/app/Http/Controllers/Api/.
- backend/database/seeder/RoleAndPermissionSeeder.php; backend/app/Models/User.php; backend/app/Services/Auth/CompanyAccess.php.
- frontend/package.json; backend/composer.json; docker-compose.yml; docs/product-requirements.md; docs/dashboard-test-report.md.
- When documentation and source code differ, this guide favors the inspected implementation. No application source files were changed to prepare it.
